

Cubic B-spline: compact support

Gaussian RBF: fast decay

Chebyshev: global support

change $\Delta\phi(u) = \delta \psi_2(u)$ produced by the update $c_2 \leftarrow c_2 + \delta$ (knot $z_2 = -0.5$; for Chebyshev the second polynomial, T_1)

interval actually reached by layer-1 inputs after normalisation, $u = \tanh(\text{state}) \in [0.25, 1]$ — the other four basis functions
